# Florida Estimates of Population: April 1, 2014

## Guidelines for Population Estimates

This report provides population estimates for Florida and each of its counties and incorporated cities, as of April 1, 2014. These estimates were prepared under a contractual agreement between the Florida Legislature and the Bureau of Economic and Business Research (BEBR) at the University of Florida. The basic guidelines for producing population estimates were established by the 1972 Florida Legislature in Chapter 23, Section 23.019, Florida Statutes, entitled "Population census determination." These guidelines have been revised several times since 1972, the most recent revision was in 2000. Section 186.901 of the 2014 Florida Statutes states:

(1) The Office of Economic and Demographic Research shall annually provide to the Executive Office of the Governor population estimates of local governmental units as of April 1 of each year, utilizing accepted statistical practices. The population of local governments provided by the Office of Economic and Demographic Research shall apply to any revenue sharing formula with local governments under the provisions of ss. 218.20-218.26, part II of chapter 218. The Office of Economic and Demographic Research shall additionally provide the Executive Office of the Governor population estimates for municipal annexations or consolidations occurring during the period April 1 through February 28, and the Executive Office of the Governor shall include these estimates in its certification to the Department of Revenue for the annual revenue-sharing calculation.

(2) (a) Population shall be computed as the number of residents, employing the same general guidelines used by the United States Bureau of the Census.

(b) For the purpose of revenue-sharing distribution formulas and distribution proportions for the local government half-cent sales tax, inmates and patients residing in institutions operated by the Federal Government, the Department of Corrections, the Department of Health, or the Department of

Children and Family Services shall not be considered to be residents of the governmental unit in which the institutions are located.

(c) Nothing herein shall be construed to prohibit the separate determination of any categories of persons, whether resident or nonresident.

(3) In cases of annexation or consolidation, local governments shall be required to submit to the Executive Office of the Governor, within 30 days following annexation or consolidation, a statement as to the population census effect of the action.

(4) Estimates of inmates and patients pursuant to paragraph (2)(b) shall be separately stated in population reports issued pursuant to this section.

It should be noted that these estimates refer solely to permanent residents of the state of Florida. According to Census Bureau guidelines, one's permanent residence is the place one lives and sleeps most of the time. Consequently, temporary residents such as tourists and snowbirds are not included in these estimates. Many places in Florida have large numbers of temporary residents during certain times of the year, making their total de facto populations much larger than their permanent resident populations.

## Estimation Methodology

The BEBR produces population estimates using the housing unit method, in which changes in population are reflected by changes in occupied housing units. This is the most commonly used method for making local population estimates in the United States because it can utilize a wide variety of data sources, can be applied at virtually any level of geography, and has a proven track record for producing reasonably accurate estimates.

The foundation of the housing unit method is the fact that almost everyone lives in some type of housing structure, whether a traditional single family unit, an apartment, a mobile home, or group quarters; such as

a college dormitory, military barrack, nursing home, or prison. The population of any geographic area can therefore be calculated as the number of occupied housing units (households) times the average number of persons per household (PPH), plus the number of persons living in group quarters facilities. For purposes of population estimation, the homeless population is treated as part of the group quarters population.

### Households

Three data series are used to estimate the number of households: residential building permits, active residential electric customers and homestead exemptions. The housing inventory for a city or county which issues building permits can be estimated by adding permits issued since 2010 to the units enumerated in the 2010 census and subtracting units lost to destruction, demolition, or conversion to other uses. Building permit data are collected through a cooperative program of the BEBR and the United States Department of Commerce. The time lag between the issuance of a permit and the completion of the structure is assumed to be three months for single-family units and 15 months for multifamily units; no lag is assumed for mobile home units or demolitions. Creating a housing inventory for an entire county requires complete permit data for every permitting agency within the county. Although such data are not always available, coverage is sufficient in most Florida cities and counties to provide useful information. Data for mobile homes are derived from state licensing and property appraisal records.

There are no data sources that track changes over time in occupancy rates. Census definitions require a person to be "...counted as an inhabitant of his usual place of residence, which is generally construed to mean where he lives and sleeps most of the time. This residence is not necessarily the same as his legal residence, voting residence, or domicile." Under this definition, a unit is counted as vacant even though it is continuously occupied, if the occupants are different persons, each of whom stays for only a short time. The most effective way to estimate current occupancy rates is to conduct a special census or large sample survey; in most instances, however, special censuses and surveys are too expensive to be feasible. A common solution is to use the occupancy rates from the most recent census; this is the procedure followed by the BEBR.

The product of the inventory figure and the occupancy rate provides an estimate of permanent households.

There are several problems with this estimate. Time lags between issuance of permits and completion of units may vary from place to place and from year to year. The proportion of permits resulting in completed units is usually unknown. Data on demolitions, conversions, and mobile homes are often incomplete or inaccurate. Measures of current occupancy rates are generally unavailable. In spite of these problems, building permit and mobile home data often provide useful estimates of the number of households.

Our second data source for estimating households is active residential electric customers. The current number of households can be estimated by multiplying the 2010 ratio of households to active residential electric customers times the current number of active residential customers. This procedure assumes that no changes have occurred in either electric company bookkeeping practices or the proportion of customers who are permanent residents. Although changes do occur, the evidence shows that they are generally quite small. In some places, however, we adjust the household/electric customer ratio to account for apparent changes in the proportion of total housing units occupied by permanent residents.

We have recently begun using a third data source, the number of homestead exemptions. We use a procedure similar to the one used for electric customers, constructing a ratio of households to exemptions in 2010 and multiplying that ratio by the current number of exemptions. An important advantage of these data is that they cover only housing units occupied by permanent residents, thereby excluding the impact of seasonal and other non-permanent residents. The primary disadvantage is that they do not include households occupied by renters or other non-homeowners. We currently use these data only for estimates at the state and county level, but we are exploring their use in subcounty areas as well.

Electric customer data generally provide good household estimates but do not provide information on changes in the mix of housing units (single-family, multifamily, mobile home). Homestead exemption data also appear to provide good household estimates. Building permit data provide somewhat less accurate estimates of households, but provide information on changes in housing mix. We use our professional judgement to decide which data source(s) to use in each county and subcounty area. In many instances, we use averages of estimates from two or even all three data sources. The benefits of combining estimates or projections are well-known.

## Persons per household

The second component of the housing unit method is the average number of persons per household (PPH). Table A shows that PPH in Florida declined considerably between 1950 and 1990 (especially during the 1970s). This trend was caused by declining birth rates, rising divorce rates, a growing number of young adults forming their own households, and a high rate of migration of older persons into Florida.

Florida's PPH remained relatively constant between 1990 and 2000, but rose slightly between 2000 and 2010. There is a substantial amount of variation among local areas in Florida, however, with values in 2010 ranging from 2.1 to 3.1 for counties and from less than 1.5 to more than 4.0 for subcounty areas. PPH values have risen over time in some local areas and declined in others.

For 2014, PPH estimates for each city and county were based on their 2010 values, the change in PPH since 2010 for the state as a whole (as calculated in the Current Population Survey), and the local change in the mix of single family, multifamily, and mobile home units since 2010. On average, PPH can be estimated more accurately than households.

## Group quarters population

Population in housing is estimated as the product of households and PPH. To obtain an estimate of total population, the group quarters population must be added. In most instances we estimate the group quarters population by assuming that it equals the same proportion of population in housing in 2014 as it did in 2010. For example, if the group quarters population equaled 1.5 percent of population in housing in 2010, we estimate that the current group quarters population is 1.5 percent of the current estimate of population in housing. In places where the group quarters population represents a substantial proportion of the total population (e.g., college dormitories, prisons, military bases, long-term health care facilities), actual population counts are obtained from the administrators of each facility. The total population estimate is then made by adding the group quarters population to the estimate of population in housing. Inmates in state and federal institutions are counted separately in all local areas; these numbers are available from the Florida Department of Corrections, the Florida Department of

**Table A. Persons per Household (PPH), Florida, 1950-2010**

Year	PPH	Year	PPH
1950	3.22	1990	2.46
1960	3.11	2000	2.46
1970	2.90	2010	2.48
1980	2.55

## **Conclusion**

The population estimates produced by the BEBR are calculated by multiplying the number of households by the average number of persons per household and adding the number of persons living in group quarters. This methodology is conceptually simple but effective. It utilizes data that are available for all local areas, its components respond rapidly to population movements, and it can be applied systematically and uniformly everywhere in the state. A comparison of population estimates with census counts for 1980, 1990, 2000 and 2010 showed the BEBR estimates to be quite accurate. Our 42 years of experience making population estimates have convinced us that this is the most effective method for making city and county population estimates in Florida.

## **Note**

The population numbers for 1990 and 2000 shown in this report include all official corrections made by the U.S. Census Bureau. Corrections for 2010 include all corrections received from the Census Bureau's Count Question Resolution program by February 11, 2014. Consequently, the census numbers for some cities or counties may differ from those published previously.

## **Acknowledgement**

Funding for these estimates was provided by the Florida Legislature.
