

Special Population Reports

Revised Annual Population Estimates for Florida and Its Counties, 2010–2020, with Components of Growth

Stefan Rayer, Population Program Director
Richard Doty, GIS Coordinator/Research Demographer
Suzanne Roulston-Doty, GIS Project Manager/Research Demographer
Ying Wang, Research Demographer

Population counts from the 2020 Census show that Florida's population grew by more than 2.7 million during the past decade, an increase of 14.5% since 2010. The numeric increase was the second largest among the 50 states and the percent increase was the ninth largest. Fifty of the state's 67 counties gained population during the decade, with four growing by more than 30% and another sixteen growing by at least 15%.

The Bureau of Economic and Business Research (BEBR) has made population estimates for every city and county in Florida each year since 1972. These estimates are based on previous census counts and symptomatic indicators of population change such as active residential electric customers, building permits, and homestead exemptions. The estimates are used for a variety of budgeting and planning purposes in both the public and private sectors, including the distribution of billions of dollars in state revenue-sharing funds each year.

The population estimates prepared by BEBR for April 1, 2020 were very accurate. The state estimate was less than 0.3% higher than the Census 2020 count. For counties, the estimates had an average error of 1.0% when the direction of error was accounted for and 2.8% when it was not. Errors were less than 2% in 34 counties, between 2% and 5% in 22 counties,

and greater than 5% in only 11 counties. The estimates were higher than the census counts in 36 counties and lower in 31 counties.

For most counties, then, the population estimates published by BEBR during the decade provided reasonably accurate indications of population change. Nevertheless, there are several reasons for producing a revised series of annual estimates. First, a revised series can correct for errors in the data used to construct the original estimates. Second, a revised series can draw on data that were not available when the original estimates were produced. Finally, and perhaps most important, a revised series can incorporate the results of the 2020 Census, providing annual estimates that are consistent with both the 2010 and 2020 counts.

For the state and most counties, the revised estimates published in this report did not differ substantially from the estimates originally published by BEBR. Years with rapid growth in the original estimates generally had rapid growth in the revised estimates, and years with slow growth in the original estimates generally had slow growth in the revised estimates. We believe the revised estimates provide a more accurate picture of annual population changes during the decade than the estimates published originally.

Analysis of Trends

Table 1 shows revised population estimates for the state and each county for April 1 of each year between 2010 and 2020.¹ These estimates refer solely to permanent residents, thereby excluding seasonal and other non-permanent residents. They include persons living in prisons, nursing homes, college dormitories, and other group quarters facilities as well as persons living in households.

Table 2 shows changes in the permanent resident population for each year. For the state as a whole, annual increases went up each year throughout the decade, from about 147,000 in 2010–2011 to almost 350,000 by 2019–2020. To put these annual increases in perspective, the state grew by about 295,000 persons per year, on average, between 1970 and 2020. The below average population growth in the first four years of the decade reflects the gradual recovery of the state from the Great Recession of 2007 to 2009. By the middle of the decade, population growth was close to Florida’s long-term average, and the annual increases were above average in the final five years of the decade.

While the majority of Florida counties experienced population growth of at least 5% between 2010 and 2020, there were seventeen counties that declined in population. This is an unusually high number of Florida counties experiencing population losses over a decade. For comparison, there were only two counties that lost population in the 2000s and 1980s, and from 1990 to 2000 all 67 Florida counties grew in population, although many counties had an annual population decline at least once during these decades. With the exception of Putnam County, all counties that lost population over the past decade had small populations under 50,000; most were non-coastal, and located in the Florida Panhandle, in North-Central Florida, or in the South-Central interior of the state. Some of the population losses can be attributed to hurricane-related impacts or changes in the group quarters population, while others reflect low migration and/or deaths exceeding

births. One should also consider the possibility of errors in the decennial census counts themselves. Evaluations of the quality of the Census 2020 counts are still in the early stages, but the evidence so far points to no greater problems than in previous years. Furthermore, for ten of the seventeen counties experiencing population declines between 2010 and 2020, both the original BEBR estimates and the Census Bureau’s estimates also showed population losses, and another two counties had a declining population in one of the two estimates series. Thus, while the number of Florida counties experiencing population declines over the past decade was unusually high, these losses were not entirely unexpected. Finally, we note that the population declines from 2010 to 2020 were quite small overall, amounting to a population loss of under 20,000 persons for the seventeen counties combined.

Tables 3–6 show the components of change for each year. Calendar-year data on births and deaths were provided by the Florida Department of Health, Bureau of Vital Statistics; we transformed those data into April-to-April numbers by assuming that one-quarter of the births and deaths each year occurred in January, February, and March.² Natural increase was calculated as the difference between the numbers of births and deaths for each year. Net migration was calculated as the difference between total population change and natural increase; it reflects the difference between the number of people moving into an area each year and the number moving out.

For the state as a whole, the number of births stayed quite stable during the first three years of the decade, it went up from 2013 to 2017, and then declined again during the last three years. Deaths followed an upward trend throughout the decade, reflecting the aging of Florida’s population. As a result of these trends, natural increase declined from about 42,000 in 2010–2011 to under 10,000 in 2019–2020.

Most counties followed similar birth and death trends over the course of the decade, but levels of natural increase differed dramatically from county to

county, primarily because of differences in age structure and racial/ethnic composition. In the last year of the decade, natural increase ranged from negative 4,321 in Pinellas County to positive 9,086 in Miami-Dade County. Forty-two counties had more deaths than births in the last year of the decade, compared to 27 counties in the first year.

At the state level, net migration rose from just over 105,000 in 2010–2011 to about 339,000 in 2019–2020. This upward trend throughout the decade is consistent with the gradual recovery from the Great Recession. Net migration has been the major contributor to Florida’s overall population growth for many years, with natural increase accounting for only a relatively small proportion. Over the past decade, almost 90% of total population growth came from net migration, ranging from about 72% in 2010–2011 to over 97% by 2019–2020.

The number of counties with net in-migration – that is, more people were moving in than moving out – increased over the decade. In 2010–2011, no Florida county had net in-migration above 10,000, whereas in the last two years of the decade there were fourteen counties where net in-migration exceeded that level. Net out-migration was less common and at comparatively lower levels, which is not surprising, since Florida is a fast-growing state. The lowest annual net out-migration was about -8,000 in Bay County in 2018–2019, which can be attributed to the devastation brought about by Hurricane Michael, which struck the Florida Panhandle in October 2018. Net migration losses not related to natural disasters never went below -1,500 in any county in any year of the past decade.

Methodology

The revised series of annual estimates of total population was based on seven independent sets of annual county estimates: (1) population estimates produced by BEBR; (2) population estimates produced by the U.S. Census Bureau; (3) housing unit estimates produced by the U.S. Census Bureau;

(4) estimates based on changes in active residential electric customers; (5) estimates based on changes in homestead exemptions; (6) estimates based on changes in building permits; and (7) estimates based on driver’s licenses exchanges from other states and from abroad. The methodology for producing the revised estimates was the same for all seven sets. As an illustration of the procedure, we provide an example of the main steps that were used to revise the series of population estimates originally published by the U.S. Census Bureau for Alachua County.

The U.S. Census Bureau produces annual population estimates for all counties in the United States using data on births, deaths, and migration. We adjusted these estimates by subtracting the institutional population (i.e., persons living in prisons or state hospitals) from the counts of total population in each year, providing counts of the non-institutional population. We then rescaled the estimates using standardization techniques, which resulted in a revised set of annual population changes that matched the overall change from Census 2010 to Census 2020.

According to the original postcensal U.S. Census Bureau estimates, the population of Alachua County increased by 23,661 persons from 2010 to 2020; excluding an institutional population change of -775 over the decade resulted in a non-institutional population change of 24,436. We calculated the mean (2,444) and standard deviation (1,099) of these annual non-institutional population changes. Next we derived standardized values of these annual changes using Z-score normalization, which were calculated as follows: $Z = (x - \bar{x}) \div s$, where x is the annual non-institutional population change, \bar{x} is the mean of the 2010–2020 annual non-institutional population changes, and s is the standard deviation of the 2010–2020 annual non-institutional population changes. The standardized values have a mean of zero and a standard deviation of one. Values above zero indicate that an annual population change for a particular year was above the mean; values below zero indicate the opposite. For Alachua County, the standardized values for this set of estimates ranged from

-1.45 in 2018–2019 to +1.94 in 2015–2016 (the corresponding non-institutional population changes for these years were 848 and 4,580, respectively).

The next step was to calculate the non-institutional population change over the decade based on the Census 2010 and Census 2020 counts, as well as the mean. For Alachua County, this amounted to 31,907 (mean = 3,191). This indicates that the non-institutional population change from 2010 to 2020, as measured by the original postcensal U.S. Census Bureau estimates series, was too low by 7,471 persons. To get a revised series of annual population changes that incorporates the Census 2020 counts, we multiplied the above described standardized values for each year by the standard deviation of the original Census Bureau estimates series, and then added the mean of the non-institutional population change between Census 2010 and Census 2020. As shown above, for Alachua County, the original Census Bureau estimates had a non-institutional population change of 848 for 2018–2019; the revised population change for the same year amounted to 1,595 ($-1.45 \times 1,099 + 3,191$). Next, we added these revised annual population changes to the Census 2010 non-institutional population to derive a revised population estimate for each year. Finally, we added back the institutional populations. This process yielded a revised set of annual population estimates that were based on the original Census Bureau estimates but were consistent with 2020 Census counts.

We followed an identical procedure to produce six additional sets of revised population estimates, one for each of the other six data series. From these

seven sets, we calculated averages which differed by the weights placed on each of the seven indicators. The final series was based on our professional judgment and used the following weighting: 50% ($\frac{1}{2}$) BEBR estimates, and one twelfth (about 8.33%) for each of the other six sets of revised population estimates. We applied this weighting scheme for every county in the state.

Conclusion

The revised county population estimates published here are consistent with each other and with the 2010 and 2020 Census counts. We believe they provide a more realistic picture of the annual population changes than the estimates published originally. The revised estimates are still subject to error, of course, due to errors in the underlying data and the census counts themselves. In spite of these shortcomings, we believe the revised estimates provide accurate and useful information regarding annual changes in total population and the components of growth for Florida and its counties between 2010 and 2020.

Acknowledgement

Funding for these revised annual population estimates was provided by the Florida Legislature.

¹ The 2010 Census numbers shown in this report may differ from those published previously because they include corrections made by the U.S. Census Bureau. We also made an adjustment to the 2010 Census number in Gadsden County to account for a missing institutional facility.

² For 2020, we made an adjustment to the vital statistics data to account for the impact of the COVID-19 pandemic.
